

Clinical Study Report — Protocol NWD-2024-11

Primary endpoint was met in the treatment arm with a hazard ratio of 0.68 and a confidence interval of 0.51 to 0.89. The study enrolled 412 patients across nine sites between March 2023 and January 2024.

Secondary endpoints were directionally consistent but did not reach the prespecified significance threshold. No new safety signals were observed.
